Abstract

Definition of structured categories; the particular case of double categories, which admit a category of quadruplets as a quotient category.

1 Double categories

p. 1198

[Comm.] This note is developed in [63].

Definition. We define a *double category* to be a class $\mathcal{C}$ endowed with two composition laws, denoted $\bullet$ and $\perp$, satisfying the following conditions:

1. $(\mathcal{C}, \bullet)$ is a category, denoted $\mathcal{C}^\bullet$; the right and left units of $f \in \mathcal{C}$ will be denoted by $\alpha^\bullet(f)$ and $\beta^\bullet(f)$ respectively, and the class of units by $\mathcal{C}_0^\bullet$;
2. $(\mathcal{C}, \perp)$ is a category, denoted $\mathcal{C}^\perp$; the units of $f \in \mathcal{C}^\perp$ will be denoted by $\alpha^\perp(f)$ and $\beta^\perp(f)$ respectively, and the class of units by $\mathcal{C}_0^\perp$;
3. The maps $\alpha^\bullet$ and $\beta^\bullet$ (resp. $\alpha^\perp$ and $\beta^\perp$) are functors from $\mathcal{C}^\perp$ to $\mathcal{C}^\perp$ (resp. from $\mathcal{C}^\bullet$ to $\mathcal{C}^\bullet$);
4. *Axiom of permutability.* If the composites $k \bullet h$, $g \bullet f$, $k \perp g$, and $h \perp f$ are defined, then
$$(k \bullet h) \perp (g \bullet f) = (k \perp g) \bullet (h \perp f).$$

Let $\mathcal{C}$ be a class endowed with two composition laws $\bullet$ and $\perp$ satisfying axioms 1 and 2; consider the following axioms:

3'. $\mathcal{C}_0^{\bullet}$ (resp. $\mathcal{C}_0^{\perp}$) is stable with respect to $\perp$ (resp. to $\bullet$);

4'. If the composites $k \bullet h$, $g \bullet f$, $k \perp g$, and $h \perp f$ are defined, then both $(k \bullet h) \perp (g \bullet f)$ and $(k \perp g) \bullet (h \perp f)$ are defined and are equal to one another.

5. For all $f \in \mathcal{C}$, we have

$$\alpha^{\bullet}(\alpha^{\perp}(f)) = \alpha^{\perp}(\alpha^{\bullet}(f)), \qquad \beta^{\bullet}(\beta^{\perp}(f)) = \beta^{\perp}(\beta^{\bullet}(f));$$
$$\alpha^{\bullet}(\beta^{\perp}(f)) = \beta^{\perp}(\alpha^{\bullet}(f)), \qquad \alpha^{\perp}(\beta^{\bullet}(f)) = \beta^{\bullet}(\alpha^{\perp}(f)).$$

Proposition. *For $(\mathcal{C}, \bullet, \perp)$ to be a double category, it is necessary and sufficient that conditions 1, 2, 3′, 4′, and 5 be satisfied. In this case, $\mathcal{C}_0^{\perp}$ (resp. $\mathcal{C}_0^{\bullet}$) is a subcategory of $\mathcal{C}^{\bullet}$ (resp. $\mathcal{C}^{\perp}$).*

A *double subcategory* of a double category $\mathcal{C}$ is a subclass $\mathcal{C}'$ of $\mathcal{C}$ that is a subcategory of $\mathcal{C}^{\bullet}$ and of $\mathcal{C}^{\perp}$; then $\mathcal{C}'$ is a double category for the composition laws induced by $\bullet$ and $\perp$.

Definition. Let $\mathcal{C}$ be a double category; we define a *left ideal*[1] (resp. *right ideal*) of $\mathcal{C}^{\perp}$ to be a subcategory $I^{\perp}$ of $\mathcal{C}^{\perp}$ such that $\mathcal{C} \bullet I^{\perp} = I^{\perp}$ (resp. $I^{\perp} \bullet \mathcal{C} = I^{\perp}$), where $\mathcal{C} \bullet I^{\perp}$ (resp. $I^{\perp} \bullet \mathcal{C}$) is the class of composites $f \bullet g$ (resp. $g \bullet f$) for $g \in I^{\perp}$ and $f \in \mathcal{C}$. We similarly define an *ideal* of $\mathcal{C}^{\bullet}$.

p. 1199

Proposition. *Let $\mathcal{C}$ be a double category; a left ideal $I^{\perp}$ of $\mathcal{C}^{\perp}$ is a species of structures*[2] *[47b, 55] over $\mathcal{C}^{\bullet}$ for the composition law $(f,g) \mapsto f \bullet g$ if and only if $f \bullet g$ is defined, where $f \in \mathcal{C}$ and $g \in I^{\perp}$. The corresponding category $\mathscr{E}(I^{\perp})$ of hypermorphisms [47b, 55] is a double category for the composition laws*

$$(f', g') \bullet (f, g) = (f' \bullet f, g)$$

if and only if $g' = f \bullet g$; further

$$(f', g') \perp (f, g) = (f' \perp f, g' \perp g)$$

if and only if $f' \perp f$ and $g' \perp g$ are defined.

2 Double categories of squares

Let $\mathcal{C}_1$ and $\mathcal{C}_2$ be two categories with the same class of units. Let $\square(\mathcal{C}_2, \mathcal{C}_1)$ be the set of quadruples (g_2, g_1, f_1, f_2), with $f_i, g_i \in \mathcal{C}_i$ for $i = 1, 2$, such that

$$\alpha(f_1) = \alpha(f_2), \qquad \alpha(g_1) = \beta(f_2);$$
$$\beta(f_1) = \alpha(g_2), \qquad \beta(g_1) = \beta(g_2).$$

We define two composition laws on $\square(\mathcal{C}_2, \mathcal{C}_1)$:

[1] *[Comm. 1.6] This definition does not agree with the usual one ([73, 122]) in which a left ideal (or* sieve*) J of $\mathcal{C}$ is a subclass of $\mathcal{C}$ such that $J \bullet C \subset J$.*

[2] *[Comm. 2.1] For the definition of species of structures and hypermorphism categories (introduced in [47a]), cf. [63, § I, 2–3]; also ([Comm. 25.2]) the set-valued functor associated to $(\mathcal{C}^{\bullet}, \beta, \alpha^{-1}(e))$ is the partial Hom functor* $\mathrm{Hom}(e, -)\colon \mathcal{C} \to \mathrm{Set}$.

- *Longitudinal* multiplication

$$(g'_2, g'_1, f'_1, f'_2) \boxplus (g_2, g_1, f_1, f_2) = (g'_2, g'_1 g_1, f'_1 f_1, f_2)$$

  if and only if $f'_2 = g_2$;

- *Lateral* multiplication

$$(g'_2, g'_1, f'_1, f'_2) \boxminus (g_2, g_1, f_1, f_2) = (g'_2 g_2, g'_1, f_1, f'_2 f_2)$$

  if and only if $f'_1 = g_1$.

Proposition. *$\square(\mathcal{C}_2, \mathcal{C}_1)$ is a double category for longitudinal and lateral multiplication.*

Suppose that $\mathcal{C} = \mathcal{C}_1 = \mathcal{C}_2$; recall [47b, 55] that a *square* in $\mathcal{C}$ is an element $(g_2, g_1, f_1, f_2) \in \square(\mathcal{C}, \mathcal{C})$ such that $g_1 f_2 = g_2 f_1$.

Corollary. *The class $\square\mathcal{C}$ of squares in $\mathcal{C}$ is a double subcategory of $\square(\mathcal{C}, \mathcal{C})$.*

Theorem. *Let $\mathcal{C}$ be a double category; then $\mathcal{C}^\bullet$ admits a subcategory[3] of the longitudinal category $\boxplus(\mathcal{C}_0^\bullet, \mathcal{C}_0^\perp)$ as a quotient category [47b, 55], where $\mathcal{C}_0^\bullet$ (resp. $\mathcal{C}_0^\perp$) is endowed with its structure as a subcategory of $\mathcal{C}^\perp$ (resp. of $\mathcal{C}^\bullet$).*

3 Functors into a double category

Let Γ be a category and $\mathcal{C}$ a double category; let $\mathcal{F}(\mathcal{C}^\bullet, \Gamma)$ be the class of functors from Γ to $\mathcal{C}^\bullet$.

Proposition. *$\mathcal{F}(\mathcal{C}^\bullet, \Gamma)$ is a category for the composition law $(\Phi', \Phi) \mapsto \Phi' \perp \Phi$, where $(\Phi' \perp \Phi)(f) = \Phi'(f) \perp \Phi(f)$, if and only if $\Phi'(f) \perp \Phi(f)$ is defined for all $f \in \mathcal{C}$.*

p. 1200

Definition. Let $\mathcal{C}$ and $\mathcal{C}_1$ be two double categories; we define a *double functor* from $\mathcal{C}$ to $\mathcal{C}_1$ to be a map Φ from $\mathcal{C}$ to $\mathcal{C}_1$ such that Φ is a functor from $\mathcal{C}^\bullet$ to $\mathcal{C}_1^\bullet$ and a functor from $\mathcal{C}^\perp$ to $\mathcal{C}_1^\perp$. The class of double functors from $\mathcal{C}$ to $\mathcal{C}_1$ is denoted $\mathcal{F}(\mathcal{C}_1, \mathcal{C})$.

[Comm. 3.1¶] The following proposition is not correct: the class of double functors is not closed under source and target maps.

Proposition. *$\mathcal{F}(\mathcal{C}_1, \mathcal{C})$ is a subcategory of $\mathcal{F}(\mathcal{C}_1^\bullet, \mathcal{C}^\bullet)$ and of $\mathcal{F}(\mathcal{C}_1^\perp, \mathcal{C}^\perp)$; endowed with the two induced composition laws, $\mathcal{F}(\mathcal{C}_1, \mathcal{C})$ is a double category.*

Proposition. *Let $\mathcal{C}$ and $\mathcal{C}'$ be two categories; the longitudinal category $\mathfrak{N}(\mathcal{C}', \mathcal{C})$ of natural transformations [52] between functors from $\mathcal{C}$ to $\mathcal{C}'$ can be identified with the category $\mathcal{F}(\boxminus\mathcal{C}', \mathcal{C})$, by identifying the natural transformation (φ', τ, ϕ) with the functor Φ such that*

$$\Phi(f) = \big(\varphi'(f), \tau(\beta(f)), \tau(\alpha(f)), \varphi(f)\big)$$

for all $f \in \mathcal{C}$.

Consequently, if $(\mathcal{C}^\bullet, \mathcal{C}^\perp)$ is a double category, then a functor Φ from a category Γ into $\mathcal{C}^\bullet$ can be considered as a generalised natural transformation from $\alpha^\perp\Phi$ to $\beta^\perp\Phi$. We will see another generalisation of natural transformations (the double category of quintets) in a following publication.

[3] *[Comm. 2.2] cf. [63, Theorem 6].*

4 Structured categories

Let $\mathfrak{M}_0$ be a class of classes such that if it contains X then it also contains all the subsets of X, and if it contains X and X' then it also contains the product $X \times X'$; let $\mathfrak{M}$ be the category of all functions from X to Y, where $X, Y \in \mathfrak{M}_0$. Let $(\mathfrak{M}, p, \mathcal{K}, \mathcal{S})$ be a category of homomorphisms [47b, 55], with $\mathcal{S}$ containing the groupoid of invertible elements of $\mathcal{K}$; let $\mathcal{K}_0$ be the class of units of $\mathcal{K}$; we identify $h \in \mathcal{K}$ with $(\beta^{\mathcal{K}}(h), p(h), \alpha^{\mathcal{K}}(h))$.

Definition. We define a *structured category in* $\mathcal{K}$ to be a pair $(\mathcal{C}^\bullet, s)$, where $\mathcal{C}^\bullet$ is the structure of a category on $\mathcal{C} \in \mathfrak{M}_0$, and $s \in \mathcal{K}_0$ with $p(s) = \mathcal{C}$, satisfying the following conditions:[4]

1. There exists $s_0 \in \mathcal{K}_0$ such that

$$p(s_0) = \mathcal{C}_0^\bullet$$
$$(s, i_{\mathcal{C}_0^\bullet}, s_0),\ (s_0, \alpha, s),\ (s_0, \beta, s) \in \mathcal{K}$$

   where $i_{\mathcal{C}_0^\bullet}$ is the canonical injection from $\mathcal{C}_0^\bullet$ into $\mathcal{C}$, and α and β are the source and target maps (respectively) in $\mathcal{C}^\bullet$.

2. There exists a product $s \times s$ in $\mathcal{K}$ such that $p(s \times s) = \mathcal{C} \times \mathcal{C}$; if K is the subclass of $\mathcal{C} \times \mathcal{C}$ consisting of composible pairs, then there exists $s' \in \mathcal{K}_0$ such that

$$p(s') = K$$
$$(s \times s, i_K, s') \in \mathcal{K}.$$

3. writing x to denote the map $(g, f) \mapsto g \bullet f$ from K to $\mathcal{C}$, the relation $(s \times s, i_K, s') \in \mathcal{K}$ implies $(s, x, s') \in \mathcal{K}$.

Example. A structured category in $\widetilde{\mathcal{T}}$, where $\widetilde{\mathcal{T}}$ is the category of topologies, is a topological category [50].

p. 1201

Theorem. *For* $(\mathcal{C}^\bullet, \mathcal{C}^\perp)$ *to be a double category, it is necessary and sufficient that* $(\mathcal{C}^\bullet, \mathcal{C}^\perp)$ *be a structured category in the category* $\mathcal{F}$ *of functors from one category to another; in this case,* $(\mathcal{C}^\perp, \mathcal{C}^\bullet)$ *is also a structured category in* $\mathcal{F}$ *(the structure on* $\mathcal{C}^\bullet$ *is* $\mathcal{C}^\perp$*).*
